**Historical labour  
force statistics-  
actual data, seasonal  
factors, seasonally  
adjusted data**

**Statistiques  
chronologiques sur  
la population active-  
chiffres réels,  
facteurs saisonniers  
et données  
désaisonnalisées**

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Labour Force Survey Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-9448) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Uttawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831
Ontario	1-800-268-1151
Manitoba	1-800-282-8006
Saskatchewan	1(112)800-667-3524
Alberta	1-800-222-6400
British Columbia (South and Central)	112-800-663-1551
Yukon and Northern B.C. (area served by NorthwTel Inc.)	Zenith 0-8913
Northwest Territories (area served by NorthwTel Inc.)	Zenith 2-2015

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7.

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Division de l'enquête sur la population active,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 990-9448) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

## INTRODUCTION

Each year, Statistics Canada presents in this publication a selection of historical labour force statistics and related seasonal adjustment information. This issue presents the monthly unadjusted and adjusted estimates up to the end of 1984, annual averages for each series and seasonal factors up to the end of 1985.

The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out monthly. Historical estimates for many series in this publication extend back to 1966. Beginning in January 1976, following more than 3 years of development, substantial revisions to the labour force survey were introduced. The estimates from January 1975 to December 1984 are taken directly from the revised survey. For the period 1966 to 1974, the data are based on revisions to the estimates produced from the former survey. Estimates for years prior to 1966 have not been revised. Details of these changes are available on request from the Labour Force Survey Division, Statistics Canada, Ottawa, K1A 0T6.

The estimates from June 1976 given in this publication are based on population projections from the 1981 Census and will therefore differ from previously published estimates which were based on the 1976 Census.

This publication contains only a limited selection of the historical data produced from the Labour Force Survey. Persons interested in obtaining additional series should contact the Labour Force Survey Division.

Most of the series in this publication are available on CANSIM. The appropriate data bank number appears in the series' header.

### The Labour Force Survey

The statistics contained in this report are based on information obtained through a sample survey of households. Interviews are carried out in about 52,800 representative households across the country.

The sample used in the surveys of the labour force has been designed to represent all persons in the population 15 years of age and over residing in Canada, with the exception of the following: residents of the Yukon and Northwest Territories, persons living on Indian reserves, inmates of institutions and full-time members of the armed forces.

A comprehensive description of the design of the Labour Force Survey and a complete list of Self-Representing Units (SRU's), can be found in Methodology of the Canadian Labour Force Survey, Statistics Canada, Catalogue No. 71-526, Ottawa, 1976.

Monthly estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month, normally the week containing the 15th day.

Data collection is carried out during the week following the reference week. Statistics Canada interviewers contact each of the dwellings in the sample through personal and/or telephone interviews to obtain the information needed to produce the labour force data. The questionnaire used in the survey is reproduced at the back of this publication. Each interviewer contacts approximately 50 designated dwellings (the individual assignment size varies by

## INTRODUCTION

Chaque année, Statistique Canada présente dans cette publication un recueil de statistiques chronologiques sur la population active ainsi que des données désaisonnalisées connexes. La présente édition contient les estimations mensuelles (données brutes et désaisonnalisées) pour la période allant jusqu'à la fin de 1984, les moyennes annuelles de chaque série de données et les coefficients saisonniers jusqu'à la fin de 1985.

L'enquête sur la population active, lancée en novembre 1945, a eu lieu à intervalles de trois mois jusqu'à novembre 1952. Depuis lors, elle a lieu tous les mois. Les estimations chronologiques de plusieurs séries contenues dans cette publication remontent jusqu'à 1966. Après plus de 3 ans d'élaboration, des changements importants ont été apportés à l'enquête sur la population active, à partir de janvier 1976. Les estimations pour la période allant de janvier 1975 à décembre 1984 sont tirées directement de la nouvelle enquête tandis que pour la période de 1966-1974, les données sont fondées sur les révisions apportées aux estimations tirées de l'ancienne enquête. Pour les années antérieures à 1966, les estimations n'ont pas été révisées. On peut obtenir sur demande des détails sur ces changements en s'adressant à la Division de l'enquête sur la population active, Statistique Canada, Ottawa, K1A 0T6.

Les estimations à partir de juin 1976 contenues dans cette publication sont fondées sur des projections de la population établies à la base du recensement de 1981. Par conséquent, elles peuvent différer des estimations déjà publiées, qui étaient fondées sur le recensement de 1976.

La présente publication ne renferme qu'une quantité limitée de données chronologiques produites par l'enquête sur la population active. Les utilisateurs qui désirent obtenir d'autres séries de données sont priées de s'adresser à la Division de l'enquête sur la population active.

La plupart des séries comprises dans la présente publication sont disponibles dans CANSIM. Le code d'accès figure dans le titre de la série.

### L'enquête sur la population active

Les statistiques publiées ici sont fondées sur une enquête mensuelle menée auprès d'environ 52,800 ménages représentatifs d'un bout à l'autre du Canada.

L'échantillon retenu dans les enquêtes sur la population active représente toutes les personnes de 15 ans et plus résidant au Canada, à l'exception des résidents du Yukon et des Territoires du Nord-Ouest, des personnes vivant dans des réserves indiennes, des pensionnaires d'institutions et des membres à plein temps des Forces armées.

On trouvera une explication détaillée de la méthodologie de l'enquête sur la population active, et la liste complète des unités autoreprésentatives (UAR's), dans Méthodologie de l'enquête sur la population active du Canada, n° 71-526 au catalogue de Statistique Canada, Ottawa, 1976.

Les estimations mensuelles de l'emploi, du chômage et de l'inactivité se rapportent à une semaine bien précise tous les mois, soit normalement celle qui comprend le quinzième jour du mois.

La collecte des données a lieu au cours de la semaine qui suit la semaine de référence. Les interviewers de Statistique Canada communiquent avec les occupants de chacun des logements de l'échantillon, en personne et (ou) par téléphone, afin de recueillir les renseignements nécessaires pour produire les données sur la population active. Un exemplaire du questionnaire utilisé est annexé à la fin de cette publication. Chaque interviewer se met en contact avec les occupants d'environ 50 logements choisis (la taille de la tâche de chacun varie selon

type of area) and conducts a personal interview in all dwellings where interviews are being conducted for the first time. In most areas, provided the respondent agrees, subsequent interviews may be conducted by telephone, an interview technique which has been shown to have no discernable impact on the data and which offers significant savings in time and cost. For further details on the survey refer to Guide to Labour Force Survey Data, Statistics Canada, Catalogue no. 71-528.

### Definitions and Explanations

#### Labour Force

The labour force is composed of that portion of the civilian non-institutional population 15 years of age and over who, during the reference week, were employed or unemployed.

#### Employed

Employed persons are those who, during the reference week:

- (a) did any work<sup>1</sup> at all
- (b) had a job but were not at work due to:
  - own illness or disability
  - personal or family responsibilities
  - bad weather
  - labour dispute
  - vacation
  - other reason not specified above (excludes persons on layoff and persons whose job attachment was to a job to start at a definite date in the future).

#### Unemployed

Unemployed persons are those who, during the reference week:

- (a) were without work, had actively looked for work in the past four weeks (ending with reference week), and were available<sup>2</sup> for work.
- (b) had not actively looked for work in the past four weeks but had been on layoff<sup>3</sup> and were available for work.
- (c) had not actively looked for work in the past four weeks but had a new job to start in four weeks or less from reference week, and were available<sup>2</sup> for work.

#### Not in the Labour Force

Those persons in the civilian non-institutional population 15 years of age and over who, during the reference week were neither employed nor unemployed.

#### Unemployment Rate

The unemployment rate represents the number of unemployed persons expressed as a per cent of the labour force. The unemployment rate for a particular group (age; sex; marital status, etc.) is the number unemployed in that group expressed as a per cent of the labour force for that group.

(1), (2), (3) See footnotes at end of text.

le genre de région). Lorsqu'il s'agit d'un ménage interviewé pour la première fois, l'interviewer fait une visite sur place. Dans la majorité des régions, si l'enquêté y consent, les interviews subséquentes peuvent être réalisées par téléphone; cette technique ne semble pas avoir d'effet marqué sur les données et elle permet d'épargner beaucoup de temps et d'argent. Pour de plus amples détails sur l'enquête, voir le Guide d'utilisation des données de l'enquête sur la population active, n° 71-528 au catalogue de Statistique Canada.

### Définitions et explications

#### Population active

La population active comprend la partie de la population civile hors institution âgée de 15 ans et plus qui avait un emploi ou était en chômage pendant la semaine de référence.

#### Personnes occupées

Les personnes occupées sont celles qui, au cours de la semaine de référence:

- a) ont fait un travail<sup>1</sup> quelconque
- b) avaient un emploi mais n'étaient pas au travail pour l'une des raisons suivantes:
  - maladie ou invalidité
  - obligations personnelles ou familiales
  - mauvais temps
  - conflit de travail
  - vacances
  - autre raison non précisée ci-dessus (à l'exception des personnes mises à pied et de celles qui devaient commencer à travailler à une date future déterminée).

#### Chômeurs

Les chômeurs sont les personnes qui, au cours de la semaine de référence:

- a) étaient sans emploi, avaient activement cherché du travail au cours des quatre dernières semaines (y compris la semaine de référence) et étaient prêtes à travailler<sup>2</sup>.
- b) n'avaient pas activement cherché de travail au cours des quatre dernières semaines, mais avaient été mises à pied<sup>3</sup> et étaient prêtes à travailler.
- c) n'avaient pas activement cherché de travail au cours des quatre dernières semaines, mais devaient commencer un nouvel emploi dans quatre semaines ou moins à compter de la semaine de référence, et étaient prêtes à travailler<sup>2</sup>.

#### Inactifs

Il s'agit de la partie de la population civile hors institution âgée de 15 ans et plus qui n'avait pas d'emploi mais n'était pas en chômage pendant la semaine de référence.

#### Taux de chômage

Le taux de chômage représente le nombre de chômeurs exprimé en pourcentage de la population active. Le taux de chômage d'un groupe particulier (âge, sexe, état matrimonial, etc.) est le nombre de chômeurs dans ce groupe, exprimé en pourcentage de la population active dans le même groupe.

(1), (2), (3) Voir les notes à la fin du texte.

### Participation Rate

The participation rate represents the labour force expressed as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex, marital status, etc.) is the labour force in that group expressed as a percentage of the population for that group.

### Employment/Population Ratio

The employment/population ratio represents the number of persons employed expressed as a percentage of the population 15 years of age and over. The employment/population ratio for a particular group (age, sex, marital status, etc.) is the number employed in that group expressed as a percentage of the population for that group.

### Industry and Occupation

The Labour Force Survey provides information about the occupation and industry attachment of the employed and unemployed. In this report, tables are given relating to the employed by industry and occupation. These statistics are based on the 1980 Standard Occupational Classification and the 1980 Standard Industrial Classification.

### The Unemployed: Family Data

A family is defined as "a group of two or more persons who are living together in the same dwelling and who are related by blood, marriage or adoption". A person living alone or who is related to no one else in the dwelling where he/she lives is classified as an "unattached individual". The head of a family is determined by the respondent's perception of headship and as such is solely a statistical device which has no economic connotation. (A more detailed description of the derivation of family data is available on request.)

### Rounding

The "normal" rounding procedure is used in the Labour Force Survey. Unadjusted participation and unemployment rates, employment/population ratios and annual averages are calculated from unrounded figures (i.e. estimates in units), but published figures are rounded to thousands. Therefore the sum of individual rounded items may not always equal the total.

### Reference Dates

As mentioned previously, the estimates derived from the Labour Force Survey refer to a specified week each month. The following table gives the reference weeks for the years 1983, 1984 and 1985.

### Taux d'activité

Le taux d'activité représente la population active exprimée en pourcentage de la population de 15 ans et plus. Le taux d'activité d'un groupe particulier (âge, sexe, état matrimonial, etc.) est la population active dans ce groupe exprimée en pourcentage de la population dans le même groupe.

### Rapport emploi-population

Le rapport emploi-population représente le nombre de personnes occupées exprimé en pourcentage de la population de 15 ans et plus. Le rapport emploi-population d'un groupe particulier (âge, sexe, état matrimonial, etc.) est le nombre de personnes occupées dans ce groupe, exprimé en pourcentage de la population dans le même groupe.

### Branche d'activité et profession

L'enquête sur la population active fournit des renseignements sur la profession et la branche d'activité des personnes occupées et des chômeurs. Le présent bulletin contient des tableaux relatifs aux personnes occupées par branche d'activité et par profession. Ces statistiques sont fondées sur la Classification type des professions de 1980 et sur la Classification type des industries 1980.

### Les chômeurs: Statistique familiale

Une famille est "un groupe de deux personnes ou plus qui vivent ensemble dans le même logement et qui sont apparentées par le sang, le mariage ou l'adoption". Une personne qui vit seule ou qui n'est apparentée à aucun occupant du logement où il (elle) demeure est classée comme "personne seule". On établit qui est le "chef de famille" en demandant à l'enquêté qui est, selon lui, la personne qui joue ce rôle. Ce concept n'a aucune connotation économique; il ne s'agit que d'un mécanisme statistique. (On peut obtenir sur demande une description plus détaillée du calcul des données sur les familles.)

### Arrondissement

On se sert de la procédure d'arrondissement "normal" dans l'enquête sur la population active. Les taux d'activité et de chômage non ajustés, le rapport emploi-population et les moyennes annuelles sont calculés à partir de chiffres non arrondis (c'est-à-dire des estimations en unités). Cependant, les estimations publiées sont arrondies en milliers. La somme des composantes individuelles n'est pas toujours égale au total à cause de l'arrondissement.

### Dates de référence

Comme nous l'avons mentionné plus haut, les estimations tirées de l'enquête sur la population active se rapportent à une semaine précise de chaque mois. Le tableau ci-après indique les semaines de référence pour les années 1983, 1984 et 1985 inclusivement.

	1985	1984	1983
	week ending - semaine se terminant le		
January - Janvier	19	14	15
February - Février	16	18	19
March - Mars	16	17	19
April - Avril	20	21	16
May - Mai	18	19	21
June - Juin	15	16	18
July - Juillet	20	21	16
August - Août	17	18	20
September - Septembre	21	15	17
October - Octobre	19	20	15
November - Novembre	16	17	12
December - Décembre	14	15	10

Fluctuations in economic time series are caused by seasonal, cyclical and irregular movements. A seasonally adjusted series is one from which seasonal movements have been eliminated. Seasonal movements are defined as those which are caused by regular annual events such as climate, crop cycles, holidays and vacation periods. It should be noted that the seasonally adjusted series contains irregular as well as longer-term cyclical fluctuations.

The seasonal adjustment program is a complicated computer program which differentiates between these seasonal, trend and irregular movements in a series over a number of years and, on the basis of past movements, estimates appropriate seasonal factors for current data. On an annual basis, the entire historic series of seasonally adjusted data is revised in light of the most recent information on changes in seasonality.

The seasonally adjusted series in this publication have been derived using the X-11-ARIMA method developed at Statistics Canada in 1980 to improve the accuracy of seasonal factor estimates. This method is a modified version of the X-11 variant of the Census Method II seasonal adjustment program of the U.S. Bureau of the Census. The modification involves using ARIMA (autoregressive integrated moving average) models to produce twelve-month projections of the unadjusted data series; the projected data are then added to the series for purposes of seasonal adjustment. For a detailed description of the procedure, the reader is referred to the technical paper "The X-11-ARIMA Seasonal Adjustment Method" (Statistics Canada Catalogue No. 12-564 E/F). Information regarding seasonal adjustment is also available from the Labour Force Survey Division or the Time Series Research and Analysis Division, Statistics Canada.

The labour force series are seasonally adjusted using either the additive or multiplicative option of the X-11-ARIMA program depending on the structure of the series. The additive decomposition is applied when the seasonal component is independent of the trend-cycle; while the use of the multiplicative option is more appropriate when the seasonal component moves more or less together with the trend-cycle (i.e. it increases as the cycle approaches a peak and decreases as the cycle nears a trough). When the structure is additive, the seasonal component is expressed in units and when the structure is multiplicative, the seasonal component is given in percentages.

The seasonal adjustment procedures applied to the various series in this publication can be summarized as follows:

- (a) ARIMA models and the multiplicative version of the X-11;

#### Canada

- employed males 15-24, 15-19<sup>5</sup>, 25-54 and 25 and over
- unemployed males 15-19, 20-24, 15-24
- employed females 15-19, 20-24, 15-24, 25-54, and 25 and over
- unemployed females 15-19 and 25-54
- employed males full-time
- employed females full-time
- employed females part-time
- employed by industry group
- employed - actual and usual hours worked
- unemployed by industry group
- unemployed - families with at least 1 person unemployed
- not in labour force - believes no work available
- not in labour force - awaiting recall or reply

#### Newfoundland

- employed both sexes
- employed males
- employed females
- unemployed both sexes

Les fluctuations des séries chronologiques économiques sont causées par des mouvements saisonniers, cycliques et irréguliers. Une série désaisonnalisée est une série dont on a éliminé les effets des mouvements saisonniers. Les mouvements saisonniers sont ceux qui sont causés par des événements annuels réguliers comme les changements de température, les cycles agricoles et les vacances. Il convient de noter que la série désaisonnalisée contient à la fois des fluctuations irrégulières et des fluctuations cycliques à long terme.

Le programme de désaisonnalisation est un programme informatique complexe qui permet de déceler les mouvements saisonniers, tendanciels et irréguliers sur une période de plusieurs années et d'estimer à la lumière des mouvements passés, les coefficients saisonniers appropriés pour l'année en cours. Sur une base annuelle, toute la série chronologique des données désaisonnalisées est révisée à la lumière des renseignements les plus récents sur les fluctuations saisonnières.

Les séries désaisonnalisées présentées dans cette publication ont été calculées à l'aide de la méthode X-11-ARMI, mise au point à Statistique Canada en 1980 afin d'améliorer la précision des estimations des facteurs saisonniers. Cette méthode est une modification de la variante X-11 du programme de désaisonnalisation "Census Method II" du Bureau du recensement des États-Unis. Cette modification comprend l'utilisation de modèles ARMMI (autorégressifs à moyenne mobile intégrés) afin d'établir des extrapolations de douze mois de la série d'origine; on désaisonnalise alors la série en lui ajoutant les valeurs extrapolées. Le lecteur intéressé trouvera une description détaillée de cette procédure dans le document technique intitulé "La méthode de désaisonnalisation X-11 ARMMI" (n° 12-564 au catalogue de Statistique Canada). On peut également obtenir des renseignements sur la désaisonnalisation en s'adressant à la Division de la population active ou à la Division des séries chronologiques - recherche et analyse, de Statistique Canada.

Les séries de la population active sont désaisonnalisées à l'aide du modèle additif ou du modèle multiplicatif du programme X-11-ARMMI, selon la structure de la série. On utilise la décomposition additive lorsque la composante saisonnière est indépendante de la tendance-cycle; par ailleurs, il est préférable d'employer le modèle multiplicatif lorsque la composante saisonnière suit plus ou moins la tendance-cycle (c'est-à-dire qu'elle augmente lorsque le cycle approche d'un sommet, et diminue lorsque le cycle est près d'un creux). Lorsque la structure est additive, la composante saisonnière est exprimée en unités, et lorsque la structure est multiplicative, elle est indiquée en pourcentages.

On peut résumer ainsi les méthodes de désaisonnalisation appliquées aux diverses séries présentées ici:

- a) Modèles ARMMI et version multiplicative de X-11;

#### Canada

- hommes occupés 15-24 ans, 15-19 ans<sup>5</sup>, 25-54 ans et 25 ans et plus
- hommes en chômage 15-19 ans, 20-24 ans, 15-24 ans
- femmes occupées 15-19 ans, 20-24 ans, 15-24 ans, 25-54 ans et 25 ans et plus
- femmes en chômage 15-19 ans et 25-54 ans
- hommes occupés à plein temps
- femmes occupées à plein temps
- femmes occupées à temps partiel
- personnes occupées par groupe d'activité
- personnes occupées - heures effectivement et habituellement travaillées
- chômage par groupe d'activité
- chômage - famille comptant au moins un chômeur
- personnes inactives - pense qu'il n'existe pas de travail disponible
- personnes inactives - attend une réponse des employeurs ou d'être rappelé au travail

Input to the seasonal adjustment program for most series is monthly data from January 1966. Other series start at January 1970 or January 1975.

Pour la plupart des séries, le programme de désaisonnalisation utilise les données mensuelles établies depuis janvier 1966. Les autres séries remontent à janvier 1970 ou janvier 1975.

(6) See footnote at end of text.

(6) Voir la note à la fin du texte.

Seasonally adjusted estimates of the labour force are derived by summing seasonally adjusted employment and seasonally adjusted unemployment.

Seasonally adjusted employment and unemployment totals for Canada are derived by the summation of the appropriate seasonally adjusted figures for males 15-24, males 25 and over, females 15-24, and females 25 and over.

Due to each of the components being seasonally adjusted individually, the seasonally adjusted estimates for the Industry series and the Provincial series may not add to the Canada totals.

Seasonally adjusted unemployment rates are the seasonally adjusted unemployment levels expressed as a per cent of the seasonally adjusted labour force (i.e. the sum of the seasonally adjusted employment and unemployment levels).

The seasonally adjusted participation rates are the seasonally adjusted labour force estimates (i.e. the sum of the seasonally adjusted employment and unemployment levels) expressed as a per cent of the population.

The seasonally adjusted employment/population ratios are the seasonally adjusted employment levels expressed as a per cent of the population.

Seasonally adjusted unemployment and participation rates and employment/population ratios are calculated using rounded, seasonally adjusted data, except for some small series.

The final seasonal factors, the forecast seasonal factors and the length of the MCD<sup>4</sup> (months of cyclical dominance), for those series which are seasonally adjusted directly are presented in sections 9 and 10.

It should be noted that the seasonally adjusted series are revised each year to take into account current data and to generate new forecast factors for the next twelve months. The data are therefore subject to slight revisions in future issues of this publication.

### Reliability of data

#### Sampling Error

The estimates in this report are based on a sample of households. Somewhat different figures might have been obtained if a complete census had been taken using the same questionnaires, interviewers, supervisors, processing methods, etc. as those actually used in the Labour Force Survey. This difference is called the sampling error of the estimates. In the design and processing of the Labour Force Survey extensive efforts have been made to minimize the sampling error. The sampling error (expressed as a per cent of the estimate it refers to) is not the same for all estimates; of two estimates, the larger one will likely have a smaller per cent sampling error and of two estimates of the same size the one referring to a characteristic more evenly distributed throughout the population will tend to have a smaller per cent sampling variability. Also, estimates relating to age and sex are usually more reliable than other estimates of comparable size.

(4) See footnote at end of text.

On obtient les estimations désaisonnalisées de la population active en faisant la somme des données désaisonnalisées sur l'emploi et le chômage.

Les totaux désaisonnalisés de l'emploi et du chômage pour le Canada sont tirés de la somme des chiffres désaisonnalisés pour les hommes âgés de 15 à 24 ans et de 25 ans et plus, et les femmes âgées de 15 à 24 ans et de 25 ans et plus.

Comme chacune des composantes est désaisonnalisée individuellement, il est possible que les estimations désaisonnalisées des séries "par branche d'activité" et "par province" ne correspondent pas aux totaux pour le Canada.

Les taux de chômage désaisonnalisés représentent les niveaux désaisonnalisés du chômage exprimés en pourcentage des estimations désaisonnalisées de la population active (c.-à-d. la somme des niveaux désaisonnalisés de l'emploi et du chômage).

Les taux d'activité désaisonnalisés correspondent aux estimations désaisonnalisées de la population active (c.-à-d. la somme des niveaux désaisonnalisés de l'emploi et du chômage) exprimées en pourcentage de la population.

Les rapports emploi-population désaisonnalisés sont les niveaux désaisonnalisés de l'emploi exprimés en pourcentage de la population.

Les taux de chômage et d'activité, et les rapports emploi-population désaisonnalisés sont fondés sur des données désaisonnalisées arrondies, sauf pour quelques petites séries.

Les coefficients saisonniers définitifs, les coefficients saisonniers d'extrapolation prospective et la durée des MDC<sup>4</sup> (mois à dominance cyclique) pour les séries directement désaisonnalisées se trouvent aux sections 9 et 10.

Il importe de noter que les données désaisonnalisées sont révisées chaque année afin de tenir compte des données courantes et produire des coefficients d'extrapolation prospective pour les 12 prochains mois. Les données d'extrapolation prospective seront l'objet de légères révisions dans les éditions ultérieures de la présente publication.

### Fiabilité des données

#### Erreur d'échantillonnage

Les estimations présentées ici sont fondées sur un échantillon de ménages. On aurait pu obtenir des chiffres légèrement différents si l'on avait fait un recensement complet à l'aide des mêmes questionnaires, des mêmes interviewers, des mêmes méthodes d'exploitation, etc. que ceux utilisés pour l'enquête sur la population active. Cette différence s'appelle l'erreur d'échantillonnage. Dans le plan et la mise en oeuvre de l'enquête sur la population active, rien n'a été négligé pour réduire au minimum l'erreur d'échantillonnage. L'erreur d'échantillonnage (exprimée en pourcentage de l'estimation visée) n'est pas la même pour toutes les estimations; de deux estimations, la plus forte comporte vraisemblablement la plus faible erreur d'échantillonnage et de deux estimations du même ordre, celle qui porte sur la caractéristique la plus uniformément répartie dans la population présente ordinairement le pourcentage le moins élevé de variabilité due à l'échantillonnage. De même, les estimations relatives à l'âge et au sexe sont habituellement plus fiables que d'autres estimations de taille comparable.

(4) Voir la note à la fin du texte.

## Non-sampling Error

Errors which are not related to sampling may occur at almost every phase of a survey operation. Interviewers may misunderstand instructions, respondents may make errors in answering questions, the answers may be incorrectly entered on the questionnaires and errors may be introduced in the processing and tabulation of the data. All of these errors are called non-sampling errors. Some of the non-sampling errors will usually balance out over a large number of observations but systematically occurring errors will contribute to biases. Non-sampling errors can be reduced by careful design of questionnaires, intensive training and supervision of interviewers and a thorough control of the processing operation. In general, the more personal and more subjective inquiries are subject to larger errors. Also, data referring to persons with less stable labour force status will have relatively larger non-sampling errors.

### (a) Quality Control

Every effort is made to reduce the occurrence of non-sampling errors in the survey. In addition to the design, training and supervision noted above, the survey uses recognized quality control procedures at every step of the data collection and processing phases to monitor the quality of the data. These controls include an Interviewer Observation program and a Reinterview program dealing with such aspects as interviewer performance and respondent induced errors, a Data Capture Quality program which maintains capture errors below a pre-determined acceptable ceiling, coding and editing quality checks, and a regular ongoing review of all survey processing functions.

### (b) Survey Response

One major source of non-sampling error is the effect of non-response on survey results. Non-response is made up of two components: item non-response, and total non-response. Several methods are used to compensate for item non-response, such as deriving a suitable response based on other information collected in the survey, using data obtained from the respondent during a previous interview, or choosing a response from a respondent with similar demographic and socio-economic characteristics. Total non-response is handled by either using information from a previous interview or re-weighting the results to compensate for the missing data.

The non-response rate for the Labour Force Survey is among the lowest in the world for a survey of this type. In 1984, the rate averaged less than 5% throughout the year.

## Weighting

The data are weighted up to independently derived population estimates produced each month by province, age, and sex. These estimates are shown in Section 8 and are subject to revision after each Census. The weighting process takes into account non-response, growth in sample size and changes in the distribution of dwellings within provinces. Further information about the weighting process can be found in Methodology of the Canadian Labour Force Survey, catalogue 71-526.

## Indicators of Standard Deviation

The sampling error, as described above, is not known. However, a measure called the standard deviation, can be estimated from the sample data. The

## Erreur non due à l'échantillonnage

D'autres erreurs, qui n'ont pas trait à l'échantillonnage, peuvent se produire à presque toutes les étapes d'une enquête. Les interviewers peuvent mal comprendre les instructions, les enquêtés peuvent donner des réponses erronées, les réponses peuvent être mal notées sur les questionnaires et d'autres erreurs peuvent être commises lors de l'exploitation et de la totalisation des données. Toutes ces erreurs s'appellent des erreurs non dues à l'échantillonnage. Certaines s'annulent sur un grand nombre d'observations, mais les erreurs systématiques engendrent des biais. Il est possible de réduire ce genre d'erreurs par une conception soignée des questionnaires, par une formation et une surveillance intensive des interviewers et par un contrôle serré de l'exploitation. En général, plus les questions prennent un caractère personnel et subjectif, plus les erreurs sont considérables. De même, les données relatives à des personnes dont la situation est moins stable présenteront un nombre relativement élevé d'erreurs non dues à l'échantillonnage.

### a) Contrôle qualitatif

Tous les efforts sont déployés dans l'enquête en vue de réduire la fréquence des erreurs non dues à l'échantillonnage. Outre la conception des questionnaires, la formation et la surveillance des interviewers dont nous avons parlé précédemment, l'enquête fait appel à des méthodes reconnues de contrôle qualitatif à toutes les étapes de la collecte et du traitement afin de surveiller la qualité des données. Ces contrôles comprennent un programme d'observation et un programme de réinterview qui permettent d'évaluer le rendement des interviewers et de déceler les erreurs attribuables aux enquêtés, un programme de contrôle qualitatif de la saisie des données qui sert à limiter les erreurs en deça d'un niveau acceptable déterminé, des mécanismes de contrôle du codage et des vérifications et un examen continu de toutes les fonctions de traitement de l'enquête.

### b) Taux de réponse à l'enquête

L'une des principales sources d'erreurs non dues à l'échantillonnage est l'effet de non-réponse sur les résultats de l'enquête. Il y a deux sortes de non-réponse: la non-réponse à une ou plusieurs questions et la non-réponse totale. On a recours à diverses méthodes pour remédier au premier type de non-réponse, notamment en imputant une réponse qui s'inspire d'autres données recueillies dans l'enquête, en utilisant les données d'une interview antérieure ou en prenant la réponse d'un enquêté qui présente des caractéristiques démographiques et socio-économiques semblables. Pour pallier la non-réponse totale, on utilise les données d'une interview antérieure ou l'on effectue une nouvelle pondération pour compenser l'absence de certaines données.

Le taux de non-réponse à l'enquête sur la population active est parmi l'un des plus faibles au monde pour une enquête de ce genre. En 1984, le taux moyen est demeuré inférieur à 5% durant toute l'année.

## Pondération

Les données sont pondérées en hausse en fonction d'estimations démographiques indépendantes déterminées chaque mois par province, par âge et par sexe. Ces estimations sont présentées à la section 8 et font l'objet de révisions après chaque recensement. Le processus de pondération tient compte de la non-réponse, de l'expansion de l'échantillon et des variations dans la répartition des logements dans les diverses provinces. Pour de plus amples renseignements au sujet du processus de pondération, consulter Méthodologie de l'enquête sur la population active du Canada, n° 71-526 au catalogue.

## Indicateurs de l'écart-type

L'erreur d'échantillonnage, telle qu'elle est décrite plus haut, n'est pas connue. Cependant, il est possible d'estimer une mesure appelée l'écart-type à partir des données

standard deviation of an estimate is a statistical measure of the variability in the estimate of a characteristic which could be expected if repeated samples of the same type were used to derive these estimates hence, it is a measure of sampling error. It also partially measures the effect of non-sampling error, but does not reflect any systematic biases in the data. The chances are about 68 out of 100 that the difference between a sample estimate and the corresponding census figure would be less than one standard deviation. The chances are about 95 out of 100 that the difference would be less than twice the standard deviation and about 99 out of 100 that it would be less than  $2\frac{1}{2}$  times as large.

Alphabetic symbols of standard deviation are used in this publication to give an indication of the reliability of the estimates and are based on a 12-month average of the per cent standard deviations in the previous calendar year.

The letter "A" indicates that the estimate is very reliable; the letter "B" indicates that the data is reliable but to a somewhat lesser degree than the "A" category; and so on. Generally, published estimates are in the categories "A" to "F" and should be considered reliable enough for most purposes. Some data with a higher variability (in the "G" and "H" categories) are reliable enough for some purposes, however they should be used with great caution. Therefore, in any subsequent use, specific reference should be made to the high sampling variability of data in the "G" and "H" categories.

The letter "J" indicates either that the estimate has a variability of more than 33.3% and/or is less than 4,000. Estimates subject to sampling error of this magnitude are not published and are indicated in the tables by (...).

The table below shows the alphabetic categories in terms of their per cent standard deviation. For example, a letter "B" beside an estimate indicates that one standard deviation is in the range 0.6 to 1.0% of the estimate. For example, an estimate of 3,000,000 persons in the labour force between the ages of 15 to 24 would have an alphabetic indicator of "B". Hence, the standard deviation for this estimate lies in the range from 18,000 to 30,000. There is a 68% chance that the true value of the estimate will be in the range from 2,970,000 to 3,030,000 and a 95% chance that it will fall between 2,940,000 and 3,060,000 persons.

de l'échantillon. L'écart-type d'une estimation est une mesure statistique de la variabilité propre à l'estimation d'une caractéristique à laquelle on pourrait s'attendre si des échantillons répétés du même type étaient utilisés pour calculer ces estimations. De ce fait, il constitue une mesure de l'erreur d'échantillonnage. L'écart-type mesure aussi, en partie, l'effet de l'erreur non due à l'échantillonnage, mais ne saisit pas les biais systématiques contenus dans les données. Il y a environ 68 chances sur 100 pour que la différence entre une estimation d'échantillon et le chiffre de recensement correspondant soit inférieure à une fois l'écart-type. Il y a 95 chances sur 100 pour que la différence soit inférieure à deux fois l'écart-type, et environ 99 chances sur 100 qu'elle soit inférieure à deux fois et demie l'écart-type.

Des symboles littéraux de l'écart-type sont utilisés dans ce bulletin comme indicateurs de la fiabilité des estimations et sont fondés sur une moyenne de douze mois des écarts-types exprimés en pourcentage pour l'année civile précédente.

La lettre "A" indique qu'il s'agit d'une estimation très fiable; la lettre "B", que l'estimation est fiable mais à un degré moindre qu'une estimation de la catégorie "A", et ainsi de suite. De façon générale, les estimations publiées entrent dans les catégories "A" à "F" et sont suffisamment fiables pour la plupart des utilisations que l'on en fait. Certaines données dont la variabilité est plus élevée (dans les catégories "G" et "H") sont suffisamment fiables pour des utilisations particulières, mais il faut les utiliser avec beaucoup de circonspection. Par conséquent, chaque fois qu'on s'en servira par la suite, il faudra préciser que leur variabilité d'échantillonnage est plus élevée.

La lettre "J" indique l'estimation a une variabilité de plus de 33.3 % et (ou) qu'elle est plus petite que 4,000. Les estimations entachées d'une erreur d'échantillonnage de cet ordre ne sont pas publiées et sont remplacées par (...) dans les tableaux.

Le tableau présenté ci-dessous indique les désignations littérales des différentes catégories d'écart-type en pourcentage. Par exemple, la lettre "B" accolée à une estimation indique que l'écart-type se situe entre 0.6 % et 1.0 % de l'estimation. Par exemple, une estimation de 3,000,000 d'actifs de 15 à 24 ans serait suivie du symbole littéral "B". Par conséquent, l'écart-type de cette estimation se situe entre 18,000 et 30,000. Il y a 68 chances sur 100 pour que la valeur vraie de l'estimation s'établisse entre 2,970,000 et 3,030,000 actifs, et 95 chances sur 100 pour qu'elle se situe entre 2,940,000 et 3,060,000 actifs.

Alphabetic designation of percent standard deviation  
Designation littérale de l'écart-type exprimé en pourcentage

Alphabetic indicator	Per cent standard deviation
Symbole littéral	Écart-type exprimé en pourcentage
A	0.0 % - 0.5 %
B	0.6 % - 1.0 %
C	1.1 % - 2.5 %
D	2.6 % - 5.0 %
E	5.1 % - 10.0 %
F	10.1 % - 16.5 %
G	16.6 % - 25.0 %
H	25.1 % - 33.3 %
J	33.4 % +

## Footnotes:

1. Work includes any work for pay or profit. That is, paid work in the context of an employer-employee relationship, or self-employment. It also includes unpaid family work where unpaid family work is defined as unpaid work which contributed directly to the operation of a farm, business or professional practice owned or operated by a related member of the household.
2. Persons in this group meeting the following criteria are regarded as available:
  - (i) were full-time students seeking part-time work who also met condition (ii) below. (Full-time students looking for full-time work are classified as not available for work in the reference week.)
  - (ii) reported that there was no reason why they could not take a job in reference week, or if they could not take a job it was because of "own illness or disability", "personal or family responsibilities", or already had a job.
3. Persons are classified as being on layoff only when they expect to return to the job from which they were laid off.
4. The MCD, or months for cyclical dominance, is a measure of the degree of smoothness in a seasonally adjusted series. It indicates the smallest span of months for which the average percent change in the trend cycle component is greater than in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 12. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.
5. Due to structural changes which have occurred in this series, data from 1984 onward have been adjusted using the multiplicative option as opposed to the additive option.
6. Due to structural changes which have occurred in this series, data from 1984 onward have been adjusted using the additive option as opposed to the multiplicative option.

## Notes:

1. On entend par "travail" tout travail fait contre rémunération ou en vue d'un bénéfice, c'est-à-dire le travail fait contre rémunération pour un employeur ou à son propre compte. Il peut également s'agir d'un travail familial non rémunéré, c'est-à-dire d'un travail non rémunéré qui contribue directement à l'exploitation d'une ferme, d'une entreprise ou d'un bureau professionnel, qui est possédé ou exploité par un membre apparenté du ménage.
2. On considère comme prêtes à travailler les personnes de ce groupe qui:
  - (i) étaient étudiants à plein temps cherchant du travail à temps partiel et qui répondaient également au critère (ii) ci-dessous. (Les étudiants à plein temps qui cherchaient du travail à plein temps ne sont pas considérés comme ayant été prêts à travailler pendant la semaine de référence.)
  - (ii) ont déclaré qu'il n'y avait aucune raison pour laquelle elles ne pouvaient prendre un emploi pendant la semaine de référence; ou ne pouvaient en prendre un en raison "d'une maladie ou d'une invalidité", "d'obligations personnelles ou familiales", ou "parce qu'elles avaient déjà un emploi".
3. On considère comme mises à pied seules les personnes qui s'attendent à réintégrer l'emploi qu'elles occupaient avant d'être mises à pied.
4. Le MDC (mois à dominance cyclique) est une mesure du degré de lissage d'une série désaisonnalisée. Il donne le plus petit nombre de mois pour lesquels le taux de variation moyen, compte non tenu du signe de la tendance générale, est supérieur à celui du facteur irrégulier. Dans le cas de la série la plus lissée possible, le MDC est égal à 1, dans celui de la série la plus irrégulière, il est égal à 12. L'application d'une moyenne mobile dont la période est égale au MDC tend à lisser les mouvements irréguliers pouvant dissimuler la tendance fondamentale.
5. Par suite des changements structurels survenus dans ces séries, les données pour 1984 ont été révisées selon la version multiplicative au lieu d'additive et le seront toujours ainsi pour les années à suivre.
6. Par suite des changements structurels survenus dans ces séries, les données pour 1984 ont été révisées selon la version additive au lieu de multiplicative et le seront toujours ainsi pour les années à suivre.

## FEUILLE DES CODES

English version  
available on request

## Questionnaire de l'enquête sur la population active (Formule 05)

14

36

- 1 Maladie ou invalidité de l'enquête
- 2 Obligations personnelles ou familiales
- 3 Va à l'école
- 4 N'a pu trouver que du travail à temps partiel
- 5 Ne voulait pas de travail à plein temps
- 6 Travail à plein temps, moins de 30 heures par semaine
- 0 Autre — Précisez dans les NOTES

59

- 1 Travaillait
- 2 Tenait maison
- 3 Allait à l'école
- 0 Autre — NE précisez PAS dans les NOTES

17

- 1 Maladie ou invalidité de l'enquête
- 2 Obligations personnelles ou familiales
- 3 Mauvais temps
- 4 Conflit de travail (grève ou lock-out)
- 5 Mise à pied, s'attend à un rappel (travailleurs rémunérés seulement)
- 6 Début d'un nouvel emploi au cours de la semaine, ou fin de l'emploi (ne s'attend pas à y retourner)
- 7 Vacances
- 8 Jour férié (ou fête religieuse)
- 9 Travail à temps réduit (en raison du manque d'équipement, de l'entretien ou de la réparation de l'usine, etc.)
- 0 Autre — Précisez dans les NOTES

62

- 1 Était malade ou invalide
- 2 Avait des obligations personnelles ou familiales
- 3 Allait à l'école
- 4 N'est plus intéressé(e) à trouver du travail
- 5 Attendait un rappel (à son emploi précédent)
- 6 A trouvé un nouvel emploi
- 7 Attendait que des employeurs lui répondent
- 8 Pense qu'il n'existe pas de travail disponible (dans la région, ou qui réponde à ses aptitudes)
- 9 N'a donné aucune raison
- 0 Autre — Précisez dans les NOTES

20

41

- 1 S'est adressé(e): À un bureau de placement public
- 2 S'est adressé(e): À un bureau de placement privé
- 3 S'est adressé(e): À un syndicat
- 4 S'est adressé(e): Directement à des employeurs
- 5 S'est adressé(e): À des amis ou des parents
- 6 A fait paraître des annonces ou a répondu à des annonces
- 7 A consulté les annonces
- 0 Autre — Précisez dans les NOTES

Oui, parce qu'il(elle):

- 1 Était malade ou invalide
- 2 Avait des obligations personnelles ou familiales
- 3 Allait à l'école
- 4 Avait déjà un emploi
- 0 Autre — Précisez dans les NOTES

63

- 5 Non (était prêt(e) à travailler)

33

- 1 Maladie ou invalidité de l'enquête
- 2 Obligations personnelles ou familiales
- 3 Mauvais temps
- 4 Conflit de travail (grève ou lock-out)
- 5 Mise à pied, s'attend à un rappel (travailleurs rémunérés seulement)
- 6 Nouvel emploi devant commencer à une date future
- 7 Vacances
- 8 Entreprise saisonnière (sauf travailleurs rémunérés)
- 0 Autre — Précisez dans les NOTES

A travaillé pour d'autres

- 1 Travailleur rémunéré
- 2 Travailleur familial non rémunéré

76

77

A travaillé à son compte

- 3 Entreprise constituée — Avec aide rémunérée
- 4 Entreprise constituée — Sans aide rémunérée
- 5 Entreprise non constituée — Avec aide rémunérée
- 6 Entreprise non constituée — Sans aide rémunérée (Comprend les travailleurs à leur compte sans entreprise)

54

- 1 Maladie ou invalidité de l'enquête
- 2 Obligations personnelles ou familiales  
Comprend: mariage, grossesse, long voyage, maladie grave dans la famille, etc.

## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Household Surveys Division,

Statistics Canada, Ottawa, K1A 0T6 (Telephone: 990-9448) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (973-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users **who reside outside the local dialing area** of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192

Yukon and Northern B.C. (area served by NorthwTel Inc.)	Zenith 0-8913

Northwest Territories (area served by NorthwTel Inc.) Call collect 420-2011

## How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0T6.

1(613)993-7276

Toronto  
Credit card only (973-8018)

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Division des enquêtes-ménages,

Statistique Canada, Ottawa, K1A 0T6 (téléphone: 990-9448) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (973-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux **utilisateurs qui habitent à l'extérieur des zones de communication locale** des centres régionaux de consultation.

## INTRODUCTION

Each year, Statistics Canada presents in this publication a selection of historical labour force statistics and related seasonal adjustment information. This issue presents the monthly unadjusted and adjusted estimates up to the end of 1985, annual averages for each series and seasonal factors up to the end of 1986.

The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out monthly. Historical estimates for many series in this publication extend back to 1966. Beginning in January 1976, following more than 3 years of development, substantial revisions to the labour force survey were introduced. The estimates from January 1975 to December 1985 are taken directly from the revised survey. For the period 1966 to 1974, the data are based on revisions to the estimates produced from the former survey. Estimates for years prior to 1966 have not been revised. Details of these changes are available on request from the Labour Force Survey Sub-Division, Statistics Canada, Ottawa, K1A 0T6.

The estimates from June 1976 given in this publication are based on population projections from the 1981 Census and will therefore differ from previously published estimates which were based on the 1976 Census.

This publication contains only a limited selection of the historical data produced from the Labour Force Survey. Furthermore, all of the series which appear in this publication which are not seasonally adjusted have been evaluated to determine their suitability for adjustment. As most of these series have exhibited sufficient seasonality to merit adjustment, this data could be provided to interested parties upon request. Persons interested in obtaining additional series should contact the Labour Force Survey Sub-Division.

Most of the series in this publication are available on CANSIM. The appropriate data bank number appears in the series' header.

### The Labour Force Survey

The statistics contained in this report are based on information obtained through a sample survey of households. Interviews are carried out in about 52,800 representative households across the country.

The sample used in the surveys of the labour force has been designed to represent all persons in the population 15 years of age and over residing in Canada, with the exception of the following: residents of the Yukon and Northwest Territories, persons living on Indian reserves, inmates of institutions and full-time members of the armed forces.

A comprehensive description of the design of the Labour Force Survey and a complete list of Self-Representing Units (SRU's), can be found in Methodology of the Canadian Labour Force Survey, Statistics Canada, Catalogue No. 71-526, Ottawa, 1976.

Monthly estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month, normally the week containing the 15th day.

Data collection is carried out during the week following the reference week. Statistics Canada interviewers contact each of the dwellings in the sample through personal and/or telephone interviews to obtain the information needed to produce the labour force data. The questionnaire used in the survey is reproduced at the back of this publication. Each interviewer contacts approximately 50 designated dwellings (the individual assignment size varies by

## INTRODUCTION

Chaque année, Statistique Canada présente dans cette publication un recueil de statistiques chronologiques sur la population active ainsi que des données désaisonnalisées connexes. La présente édition contient les estimations mensuelles (données brutes et désaisonnalisées) pour la période allant jusqu'à la fin de 1985, les moyennes annuelles de chaque série de données et les coefficients saisonniers jusqu'à la fin de 1986.

L'enquête sur la population active, lancée en novembre 1945, a eu lieu à intervalles de trois mois jusqu'à novembre 1952. Depuis lors, elle a lieu tous les mois. Les estimations chronologiques de plusieurs séries contenues dans cette publication remontent jusqu'à 1966. Après plus de 3 ans d'élaboration, des changements importants ont été apportés à l'enquête sur la population active, à partir de janvier 1976. Les estimations pour la période allant de janvier 1975 à décembre 1985 sont tirées directement de la nouvelle enquête tandis que pour la période de 1966-1974, les données sont fondées sur les révisions apportées aux estimations tirées de l'ancienne enquête. Pour les années antérieures à 1966, les estimations n'ont pas été révisées. On peut obtenir sur demande des détails sur ces changements en s'adressant à la Sous-division de l'enquête sur la population active, Statistique Canada, Ottawa, K1A 0T6.

Les estimations à partir de juin 1976 contenues dans cette publication sont fondées sur des projections de la population établies à la base du recensement de 1981. Par conséquent, elles peuvent différer des estimations déjà publiées, qui étaient fondées sur le recensement de 1976.

La présente publication ne renferme qu'une quantité limitée de données chronologiques produites par l'enquête sur la population active. De plus, toutes les séries qui n'ont pas été désaisonnalisées dans cette publication, ont été évaluées afin de déterminer leur convenance de désaisonnalisation. La plupart des séries ont démontrés des mouvements saisonniers suffisant pour mériter une désaisonnalisation; ces données seront disponibles sur demande. Les utilisateurs qui désirent obtenir d'autres séries de données sont priées de l'adresser à la Sous-division de l'enquête sur la population active.

La plupart des séries comprises dans la présente publication sont disponibles dans CANSIM. Le code d'accès figure dans le titre de la série.

### L'enquête sur la population active

Les statistiques publiées ici sont fondées sur une enquête mensuelle menée auprès d'environ 52,800 ménages représentatifs d'un bout à l'autre du Canada.

L'échantillon retenu dans les enquêtes sur la population active représente toutes les personnes de 15 ans et plus résidant au Canada, à l'exception des résidents du Yukon et des Territoires du Nord-Ouest, des personnes vivant dans des réserves indiennes, des pensionnaires d'institutions et des membres à plein temps des Forces armées.

On trouvera une explication détaillée de la méthodologie de l'enquête sur la population active, et la liste complète des unités autoreprésentatives (UAR's), dans Méthodologie de l'enquête sur la population active du Canada, n° 71-526F au catalogue de Statistique Canada, Ottawa, 1976.

Les estimations mensuelles de l'emploi, du chômage et de l'inactivité se rapportent à une semaine bien précise tous les mois, soit normalement celle qui comprend le quinzième jour du mois.

La collecte des données a lieu au cours de la semaine qui suit la semaine de référence. Les interviewers de Statistique Canada communiquent avec les occupants de chacun des logements de l'échantillon, en personne et (ou) par téléphone, afin de recueillir les renseignements nécessaires pour produire les données sur la population active. Un exemplaire du questionnaire utilisé est annexé à la fin de cette publication. Chaque interviewer se met en contact avec les occupants d'environ 50 logements choisis (la taille de la tâche de chacun varie selon

type of area) and conducts a personal interview in all dwellings where interviews are being conducted for the first time. In most areas, provided the respondent agrees, subsequent interviews may be conducted by telephone, an interview technique which has been shown to have no discernable impact on the data and which offers significant savings in time and cost. For further details on the survey refer to Guide to Labour Force Survey Data, Statistics Canada, Catalogue no. 71-528.

### Definitions and Explanations

#### Labour Force

The labour force is composed of that portion of the civilian non-institutional population 15 years of age and over who, during the reference week, were employed or unemployed.

#### Employed

Employed persons are those who, during the reference week:

- (a) did any work<sup>1</sup> at all
- (b) had a job but were not at work due to:
  - own illness or disability
  - personal or family responsibilities
  - bad weather
  - labour dispute
  - vacation
  - other reason not specified above (excludes persons on layoff and persons whose job attachment was to a job to start at a definite date in the future).

#### Unemployed

Unemployed persons are those who, during the reference week:

- (a) were without work, had actively looked for work in the past four weeks (ending with reference week), and were available<sup>2</sup> for work.
- (b) had not actively looked for work in the past four weeks but had been on layoff<sup>3</sup> and were available for work.
- (c) had not actively looked for work in the past four weeks but had a new job to start in four weeks or less from reference week, and were available<sup>2</sup> for work.

#### Not in the Labour Force

Those persons in the civilian non-institutional population 15 years of age and over who, during the reference week were neither employed nor unemployed.

#### Unemployment Rate

The unemployment rate represents the number of unemployed persons expressed as a per cent of the labour force. The unemployment rate for a particular group (age, sex, marital status, etc.) is the number unemployed in that group expressed as a per cent of the labour force for that group.

(1), (2), (3) See footnotes at end of text.

le genre de région). Lorsqu'il s'agit d'un ménage interviewé pour la première fois, l'interviewer fait une visite sur place. Dans la majorité des régions, si l'enquêté y consent, les interviews subséquentes peuvent être réalisées par téléphone; cette technique ne semble pas avoir d'effet marqué sur les données et elle permet d'épargner beaucoup de temps et d'argent. Pour de plus amples détails sur l'enquête, voir le Guide d'utilisation des données de l'enquête sur la population active, n° 71-528 au catalogue de Statistique Canada.

### Définitions et explications

#### Population active

La population active comprend la partie de la population civile hors institution âgée de 15 ans et plus qui avait un emploi ou était en chômage pendant la semaine de référence.

#### Personnes occupées

Les personnes occupées sont celles qui, au cours de la semaine de référence:

- a) ont fait un travail<sup>1</sup> quelconque
- b) avaient un emploi mais n'étaient pas au travail pour l'une des raisons suivantes:
  - maladie ou invalidité
  - obligations personnelles ou familiales
  - mauvais temps
  - conflit de travail
  - vacances
  - autre raison non précisée ci-dessus (à l'exception des personnes mises à pied et de celles qui devaient commencer à travailler à une date future déterminée).

#### Chômeurs

Les chômeurs sont les personnes qui, au cours de la semaine de référence:

- a) étaient sans emploi, avaient activement cherché du travail au cours des quatre dernières semaines (y compris la semaine de référence) et étaient prêtes à travailler<sup>2</sup>.
- b) n'avaient pas activement cherché de travail au cours des quatre dernières semaines, mais avaient été mises à pied<sup>3</sup> et étaient prêtes à travailler.
- c) n'avaient pas activement cherché de travail au cours des quatre dernières semaines, mais devaient commencer un nouvel emploi dans quatre semaines ou moins à compter de la semaine de référence, et étaient prêtes à travailler<sup>2</sup>.

#### Inactifs

Il s'agit de la partie de la population civile hors institution âgée de 15 ans et plus qui n'avait pas d'emploi mais n'était pas en chômage pendant la semaine de référence.

#### Taux de chômage

Le taux de chômage représente le nombre de chômeurs exprimé en pourcentage de la population active. Le taux de chômage d'un groupe particulier (âge, sexe, état matrimonial, etc.) est le nombre de chômeurs dans ce groupe, exprimé en pourcentage de la population active dans le même groupe.

(1), (2), (3) Voir les notes à la fin du texte.

## Participation Rate

The participation rate represents the labour force expressed as a percentage of the population 15 years of age and over. The participation rate for a particular group (age, sex, marital status, etc.) is the labour force in that group expressed as a percentage of the population for that group.

## Employment/Population Ratio

The employment/population ratio represents the number of persons employed expressed as a percentage of the population 15 years of age and over. The employment/population ratio for a particular group (age, sex, marital status, etc.) is the number employed in that group expressed as a percentage of the population for that group.

## Industry and Occupation

The Labour Force Survey provides information about the occupation and industry attachment of the employed and unemployed. In this report, tables are given relating to the employed by industry and occupation. These statistics are based on the 1980 Standard Occupational Classification and the 1980 Standard Industrial Classification.

## The Unemployed: Family Data

A family is defined as "a group of two or more persons who are living together in the same dwelling and who are related by blood, marriage or adoption". A person living alone or who is related to no one else in the dwelling where he/she lives is classified as an "unattached individual". The head of a family is determined by the respondent's perception of headship and as such is solely a statistical device which has no economic connotation. (A more detailed description of the derivation of family data is available on request.)

## Rounding

The "normal" rounding procedure is used in the Labour Force Survey. Unadjusted participation and employment rates, employment/population ratios and annual averages are calculated from unrounded figures (i.e. estimates in units), but published figures are rounded to thousands. Therefore the sum of individual rounded items may not always equal the total.

## Reference Dates

As mentioned previously, the estimates derived from the Labour Force Survey refer to a specified week each month. The following table gives the reference weeks for the years 1984, 1985 and 1986.

	1986	1985	1984
	week ending - semaine se terminant le		
January - Janvier	18	19	14
February - Février	15	16	18
March - Mars	15	16	17
April - Avril	19	20	21
May - Mai	17	18	19
June - Juin	21	15	16
July - Juillet	19	20	21
August - Août	16	17	18
September - Septembre	20	21	15
October - Octobre	18	19	20
November - Novembre	15	16	17
December - Décembre	13	14	15

## Taux d'activité

Le taux d'activité représente la population active exprimée en pourcentage de la population de 15 ans et plus. Le taux d'activité d'un groupe particulier (âge, sexe, état matrimonial, etc.) est la population active dans ce groupe exprimée en pourcentage de la population dans le même groupe.

## Rapport emploi-population

Le rapport emploi-population représente le nombre de personnes occupées exprimé en pourcentage de la population de 15 ans et plus. Le rapport emploi-population d'un groupe particulier (âge, sexe, état matrimonial, etc.) est le nombre de personnes occupées dans ce groupe, exprimé en pourcentage de la population dans le même groupe.

## Branche d'activité et profession

L'enquête sur la population active fournit des renseignements sur la profession et la branche d'activité des personnes occupées et des chômeurs. Le présent bulletin contient des tableaux relatifs aux personnes occupées par branche d'activité et par profession. Ces statistiques sont fondées sur la Classification type des professions de 1980 et sur la Classification type des industries 1980.

## Les chômeurs: Statistique familiale

Une famille est "un groupe de deux personnes ou plus qui vivent ensemble dans le même logement et qui sont apparentées par le sang, le mariage ou l'adoption". Une personne qui vit seule ou qui n'est apparentée à aucun occupant du logement où il (elle) demeure est classée comme "personne seule". On établit qui est le "chef de famille" en demandant à l'enquêteur qui est, selon lui, la personne qui joue ce rôle. Ce concept n'a aucune connotation économique; il ne s'agit que d'un mécanisme statistique. (On peut obtenir sur demande une description plus détaillée du calcul des données sur les familles.)

## Arrondissement

On se sert de la procédure d'arrondissement "normal" dans l'enquête sur la population active. Les taux d'activité et de chômage non ajustés, le rapport emploi-population et les moyennes annuelles sont calculés à partir de chiffres non arrondis (c'est-à-dire des estimations en unités). Cependant, les estimations publiées sont arrondies en milliers. La somme des composantes individuelles n'est pas toujours égale au total à cause de l'arrondissement.

## Dates de référence

Comme nous l'avons mentionné plus haut, les estimations tirées de l'enquête sur la population active se rapportent à une semaine précise de chaque mois. Le tableau ci-après indique les semaines de référence pour les années 1984, 1985 et 1986 inclusivement.

Fluctuations in economic time series are caused by seasonal, cyclical and irregular movements. A seasonally adjusted series is one from which seasonal movements have been eliminated. Seasonal movements are defined as those which are caused by regular annual events such as climate, crop cycles, holidays and vacation periods. It should be noted that the seasonally adjusted series contains irregular as well as longer-term cyclical fluctuations.

The seasonal adjustment program is a complicated computer program which differentiates between these seasonal, trend and irregular movements in a series over a number of years and, on the basis of past movements, estimates appropriate seasonal factors for current data. On an annual basis, the entire historic series of seasonally adjusted data is revised in light of the most recent information on changes in seasonality.

The seasonally adjusted series in this publication have been derived using the X-11-ARIMA method developed at Statistics Canada in 1980 to improve the accuracy of seasonal factor estimates. This method is a modified version of the X-11 variant of the Census Method II seasonal adjustment program of the U.S. Bureau of the Census. The modification involves using ARIMA (autoregressive integrated moving average) models to produce twelve-month projections of the unadjusted data series; the projected data are then added to the series for purposes of seasonal adjustment. For a detailed description of the procedure, the reader is referred to the technical paper "The X-11-ARIMA Seasonal Adjustment Method" (Statistics Canada Catalogue No. 12-564 E/F). Information regarding seasonal adjustment is also available from the Labour Force Survey Sub-Division or the Time Series Research and Analysis Division, Statistics Canada.

The labour force series are seasonally adjusted using either the additive or multiplicative option of the X-11-ARIMA program depending on the structure of the series. Seasonal adjustment of the series uses data up to and including the current month's data (concurrent seasonal adjusted). The additive decomposition is applied when the seasonal component is independent of the trend-cycle; while the use of the multiplicative option is more appropriate when the seasonal component moves more or less together with the trend-cycle (i.e. it increases as the cycle approaches a peak and decreases as the cycle nears a trough). When the structure is additive, the seasonal component is expressed in units and when the structure is multiplicative, the seasonal component is given in percentages.

The seasonal adjustment procedures applied to the various series in this publication can be summarized as follows:

- (a) ARIMA models and the multiplicative version of the X-11;

**Canada**

- employed males 15-24, 15-19<sup>5</sup>, 25-54 and 25 and over
- unemployed males 15-19, 20-24, 15-24
- employed females 15-19, 20-24, 15-24, 25-54 and 25 and over
- unemployed females 15-19 and 25-54
- employed males full-time
- employed females full-time
- employed females part-time
- employed by industry group
- employed by occupation group, excluding clerical
- employed - actual and usual hours worked
- unemployed by industry group
- unemployed - families with at least 1 person unemployed
- unemployed - looked for full-time work
- unemployed - looked for part-time work
- unemployed - flows into unemployment
- not in labour force - believes no work available
- not in labour force - awaiting recall or reply

(5) - See footnote at end of text.

Les fluctuations des séries chronologiques économiques sont causées par des mouvements saisonniers, cycliques et irréguliers. Une série désaisonnalisée est une série dont on a éliminé les effets des mouvements saisonniers. Les mouvements saisonniers sont ceux qui sont causés par des événements annuels réguliers comme les changements de température, les cycles agricoles et les vacances. Il convient de noter que la série désaisonnalisée contient à la fois des fluctuations irrégulières et des fluctuations cycliques à long terme.

Le programme de désaisonnalisation est un programme informatique complexe qui permet de déceler les mouvements saisonniers, tendanciels et irréguliers sur une période de plusieurs années et d'estimer à la lumière des mouvements passés, les coefficients saisonniers appropriés pour l'année en cours. Sur une base annuelle, toute la série chronologique des données désaisonnalisées est révisée à la lumière des renseignements les plus récents sur les fluctuations saisonnières.

Les séries désaisonnalisées présentées dans cette publication ont été calculées à l'aide de la méthode X-11-ARMMI, mise au point à Statistique Canada en 1980 afin d'améliorer la précision des estimations des facteurs saisonniers. Cette méthode est une modification de la variante X-11 du programme de désaisonnalisation "Census Method II" du Bureau du recensement des États-Unis. Cette modification comprend l'utilisation de modèles ARMMI (autoregressifs à moyenne mobile intégrés) afin d'établir des extrapolations de douze mois de la série d'origine; on désaisonnalise alors la série en lui ajoutant les valeurs extrapolées. Le lecteur intéressé trouvera une description détaillée de cette procédure dans le document technique intitulé "La méthode de désaisonnalisation X-11 ARMMI" (n° 12-564 au catalogue de Statistique Canada). On peut également obtenir des renseignements sur la désaisonnalisation en s'adressant à la Sous-division de la population active ou à la Division des séries chronologiques - recherche et analyse, de Statistique Canada.

Les séries de la population active sont désaisonnalisées à l'aide du modèle additif ou du modèle multiplicatif du programme X-11-ARMMI, selon la structure de la série. La désaisonnalisation des séries utilise les données jusqu'au mois courant inclus (désaisonnalisation concurrente). On utilise la décomposition additive lorsque la composante saisonnière est indépendante de la tendance-cycle; par ailleurs, il est préférable d'employer le modèle multiplicatif lorsque la composante saisonnière suit plus ou moins la tendance-cycle (c'est-à-dire qu'elle augmente lorsque le cycle approche d'un sommet, et diminue lorsque le cycle est près d'un creux). Lorsque la structure est additive, la composante saisonnière est exprimée en unités, et lorsque la structure est multiplicative, elle est indiquée en pourcentages.

On peut résumer ainsi les méthodes de désaisonnalisation appliquées aux diverses séries présentées ici:

- a) Modèles ARMMI et version multiplicative de X-11;

Input to the seasonal adjustment program for most series is monthly data from January 1966. Other series start at January 1970 or January 1975.

Seasonally adjusted estimates of the labour force are derived by summing seasonally adjusted employment and seasonally adjusted unemployment.

Seasonally adjusted employment and unemployment totals for Canada are derived by the summation of the appropriate seasonally adjusted figures for males 15-24, males 25 and over, females 15-24, and females 25 and over.

Due to each of the components being seasonally adjusted individually, the seasonally adjusted estimates for the Industry series, the Occupation series and the Provincial series may not add to the Canada totals.

Seasonally adjusted unemployment rates are the seasonally adjusted unemployment levels expressed as a per cent of the seasonally adjusted labour force (i.e. the sum of the seasonally adjusted employment and unemployment levels).

The seasonally adjusted participation rates are the seasonally adjusted labour force estimates (i.e. the sum of the seasonally adjusted employment and unemployment levels) expressed as a per cent of the population.

The seasonally adjusted employment/population ratios are the seasonally adjusted employment levels expressed as a per cent of the population.

Seasonally adjusted unemployment and participation rates and employment/population ratios are calculated using rounded, seasonally adjusted data, except for some small series.

The final seasonal factors, the forecast seasonal factors and the length of the MCD<sup>4</sup> (months of cyclical dominance), for those series which are seasonally adjusted directly are presented in sections 9 and 10.

It should be noted that the seasonally adjusted series are revised each year to take into account current data and to generate new forecast factors for the next twelve months. The data are therefore subject to slight revisions in future issues of this publication.

Pour la plupart des séries, le programme de désaisonnalisation utilise les données mensuelles établies depuis janvier 1966. Les autres séries remontent à janvier 1970 ou janvier 1975.

On obtient les estimations désaisonnalisées de la population active en faisant la somme des données désaisonnalisées sur l'emploi et le chômage.

Les totaux désaisonnalisés de l'emploi et du chômage pour le Canada sont tirés de la somme des chiffres désaisonnalisés pour les hommes âgés de 15 à 24 ans et de 25 ans et plus, et les femmes âgées de 15 à 24 ans et de 25 ans et plus.

Comme chacune des composantes est désaisonnalisée individuellement, il est possible que les estimations désaisonnalisées des séries "par branche d'activité", "par groupe de profession" et "par province" ne correspondent pas aux totaux pour le Canada.

Les taux de chômage désaisonnalisés représentent les niveaux désaisonnalisés du chômage exprimés en pourcentage des estimations désaisonnalisées de la population active (c.-à-d. la somme des niveaux désaisonnalisés de l'emploi et du chômage).

Les taux d'activité désaisonnalisés correspondent aux estimations désaisonnalisées de la population active (c.-à-d. la somme des niveaux désaisonnalisés de l'emploi et du chômage) exprimées en pourcentage de la population.

Les rapports emploi-population désaisonnalisés sont les niveaux désaisonnalisés de l'emploi exprimés en pourcentage de la population.

Les taux de chômage et d'activité, et les rapports emploi-population désaisonnalisés sont fondés sur des données désaisonnalisées arrondies, sauf pour quelques petites séries.

Les coefficients saisonniers définitifs, les coefficients saisonniers d'extrapolation prospective et la durée des MDC<sup>4</sup> (mois à dominance cyclique) pour les séries directement désaisonnalisées se trouvent aux sections 9 et 10.

Il importe de noter que les données désaisonnalisées sont révisées chaque année afin de tenir compte des données courantes et produire des coefficients d'extrapolation prospective pour les 12 prochains mois. Les données d'extrapolation prospective seront l'objet de légères révisions dans les éditions ultérieures de la présente publication.

(4) Voir la note à la fin du texte.

## Reliability of data

### Sampling Error

The estimates in this report are based on a sample of households. Somewhat different figures might have been obtained if a complete census had been taken using the same questionnaires, interviewers, supervisors, processing methods, etc. as those actually used in the Labour Force Survey. This difference is called the sampling error of the estimates. In the design and processing of the Labour Force Survey extensive efforts have been made to minimize the sampling error. The sampling error (expressed as a per cent of the estimate it refers to) is not the same for all estimates; of two estimates, the larger one will likely have a smaller per cent sampling error and of two estimates of the same size the one referring to a characteristic more evenly distributed throughout the population will tend to have a smaller per cent sampling variability. Also, estimates relating to age and sex are usually more reliable than other estimates of comparable size.

### Non-sampling Error

Errors which are not related to sampling may occur at almost every phase of a survey operation. Interviewers may misunderstand instructions, respondents may make errors in answering questions, the answers may be incorrectly entered on the questionnaires and errors may be introduced in the processing and tabulation of the data. All of these errors are called non-sampling errors. Some of the non-sampling errors will usually balance out over a large number of observations but systematically occurring errors will contribute to biases. Non-sampling errors can be reduced by careful design of questionnaires, intensive training and supervision of interviewers and a thorough control of the processing operation. In general, the more personal and more subjective inquiries are subject to larger errors. Also, data referring to persons with less stable labour force status will have relatively larger non-sampling errors.

#### (a) Quality Control

Every effort is made to reduce the occurrence of non-sampling errors in the survey. In addition to the design, training and supervision noted above, the survey uses recognized quality control procedures at every step of the data collection and processing phases to monitor the quality of the data. These controls include an Interviewer Observation program and a Reinterview program dealing with such aspects as interviewer performance and respondent induced errors, a Data Capture Quality program which maintains capture errors below a pre-determined acceptable ceiling, coding and editing quality checks, and a regular ongoing review of all survey processing functions.

#### (b) Survey Response

One major source of non-sampling error is the effect of non-response on survey results. Non-response is made up of two components: item non-response, and total non-response. Several methods are used to compensate for item non-response, such as deriving a suitable response based on other information collected in the survey, using data obtained from the respondent during a previous interview, or choosing a response from a respondent with similar demographic and socio-economic characteristics. Total non-response is handled by either using information from a previous interview or re-weighting the results to compensate for the missing data.

The non-response rate for the Labour Force Survey is among the lowest in the world for a survey of this type. In 1985, the rate averaged less than 5% throughout the year.

## Fiabilité des données

### Erreur d'échantillonnage

Les estimations présentées ici sont fondées sur un échantillon de ménages. On aurait pu obtenir des chiffres légèrement différents si l'on avait fait un recensement complet à l'aide des mêmes questionnaires, des mêmes interviewers, des mêmes méthodes d'exploitation, etc. que ceux utilisés pour l'enquête sur la population active. Cette différence s'appelle l'erreur d'échantillonnage. Dans le plan et la mise en oeuvre de l'enquête sur la population active, rien n'a été négligé pour réduire au minimum l'erreur d'échantillonnage. L'erreur d'échantillonnage (exprimée en pourcentage de l'estimation visée) n'est pas la même pour toutes les estimations; de deux estimations, la plus forte comporte vraisemblablement la plus faible erreur d'échantillonnage et de deux estimations du même ordre, celle qui porte sur la caractéristique la plus uniformément répartie dans la population présente ordinairement le pourcentage le moins élevé de variabilité due à l'échantillonnage. De même, les estimations relatives à l'âge et au sexe sont habituellement plus fiables que d'autres estimations de taille comparable.

### Erreur non due à l'échantillonnage

D'autres erreurs, qui n'ont pas trait à l'échantillonnage, peuvent se produire à presque toutes les étapes d'une enquête. Les interviewers peuvent mal comprendre les instructions, les enquêtés peuvent donner des réponses erronées, les réponses peuvent être mal notées sur les questionnaires et d'autres erreurs peuvent être commises lors de l'exploitation et de la totalisation des données. Toutes ces erreurs s'appellent des erreurs non dues à l'échantillonnage. Certaines s'annulent sur un grand nombre d'observations, mais les erreurs systématiques engendrent des biais. Il est possible de réduire ce genre d'erreurs par une conception soignée des questionnaires, par une formation et une surveillance intensive des interviewers et par un contrôle serré de l'exploitation. En général, plus les questions prennent un caractère personnel et subjectif, plus les erreurs sont considérables. De même, les données relatives à des personnes dont la situation est moins stable présenteront un nombre relativement élevé d'erreurs non dues à l'échantillonnage.

#### a) Contrôle qualitatif

Tous les efforts sont déployés dans l'enquête en vue de réduire la fréquence des erreurs non dues à l'échantillonnage. Outre la conception des questionnaires, la formation et la surveillance des interviewers dont nous avons parlé précédemment, l'enquête fait appel à des méthodes reconnues de contrôle qualitatif à toutes les étapes de la collecte et du traitement afin de surveiller la qualité des données. Ces contrôles comprennent un programme d'observation et un programme de réinterview qui permettent d'évaluer le rendement des interviewers et de déceler les erreurs attribuables aux enquêtés, un programme de contrôle qualitatif de la saisie des données qui sert à limiter les erreurs en deça d'un niveau acceptable déterminé, des mécanismes de contrôle du codage et des vérifications et un examen continu de toutes les fonctions de traitement de l'enquête.

#### b) Taux de réponse à l'enquête

L'une des principales sources d'erreurs non dues à l'échantillonnage est l'effet de non-réponse sur les résultats de l'enquête. Il y a deux sortes de non-réponse: la non-réponse à une ou plusieurs questions et la non-réponse totale. On a recours à diverses méthodes pour remédier au premier type de non-réponse, notamment en imputant une réponse qui s'inspire d'autres données recueillies dans l'enquête, en utilisant les données d'une interview antérieure ou en prenant la réponse d'un enquêté qui présente des caractéristiques démographiques et socio-économiques semblables. Pour pallier la non-réponse totale, on utilise les données d'une interview antérieure ou l'on effectue une nouvelle pondération pour compenser l'absence de certaines données.

Le taux de non-réponse à l'enquête sur la population active est parmi l'un des plus faibles au monde pour une enquête de ce genre. En 1985, le taux moyen est demeuré inférieur à 5% durant toute l'année.

## Weighting

The data are weighted up to independently derived population estimates produced each month by province, age, and sex. These estimates are shown in Section 8 and are subject to revision after each Census. The weighting process takes into account non-response, growth in sample size and changes in the distribution of dwellings within provinces. Further information about the weighting process can be found in Methodology of the Canadian Labour Force Survey, catalogue 71-526.

## Indicators of Standard Deviation

The sampling error, as described above, is not known. However, a measure called the standard deviation, can be estimated from the sample data. The standard deviation of an estimate is a statistical measure of the variability in the estimate of a characteristic which could be expected if repeated samples of the same type were used to derive these estimates hence, it is a measure of sampling error. It also partially measures the effect of non-sampling error, but does not reflect any systematic biases in the data. The chances are about 68 out of 100 that the difference between a sample estimate and the corresponding census figure would be less than one standard deviation. The chances are about 95 out of 100 that the difference would be less than twice the standard deviation and about 99 out of 100 that it would be less than  $2\frac{1}{2}$  times as large.

Alphabetic symbols of standard deviation are used in this publication to give an indication of the reliability of the estimates and are based on a 12-month average of the per cent standard deviations in the previous calendar year.

The letter "A" indicates that the estimate is very reliable; the letter "B" indicates that the data is reliable but to a somewhat lesser degree than the "A" category; and so on. Generally, published estimates are in the categories "A" to "F" and should be considered reliable enough for most purposes. Some data with a higher variability (in the "G" and "H" categories) are reliable enough for some purposes, however they should be used with great caution. Therefore, in any subsequent use, specific reference should be made to the high sampling variability of data in the "G" and "H" categories.

The letter "J" indicates either that the estimate has a variability of more than 33.3% and/or is less than 4,000. Estimates subject to sampling error of this magnitude are not published and are indicated in the tables by (...).

The table below shows the alphabetic categories in terms of their per cent standard deviation. For example, a letter "B" beside an estimate indicates that one standard deviation is in the range 0.6 to 1.0% of the estimate. For example, an estimate of 3,000,000 persons in the labour force between the ages of 15 to 24 would have an alphabetic indicator of "B". Hence, the standard deviation for this estimate lies in the range from 18,000 to 30,000. There is a 68% chance that the true value of the estimate will be in the range from 2,970,000 to 3,030,000 and a 95% chance that it will fall between 2,940,000 and 3,060,000 persons.

### Alphabetic designation of percent standard deviation

### Désignation littérale de l'écart-type exprimé en pourcentage

Alphabetic indicator	Per cent standard deviation
Symbole littéral	Écart-type exprimé en pourcentage
A	0.0 % - 0.5 %
B	0.6 % - 1.0 %
C	1.1 % - 2.5 %
D	2.6 % - 5.0 %
E	5.1 % - 10.0 %
F	10.1 % - 16.5 %
G	16.6 % - 25.0 %
H	25.1 % - 33.3 %
J	33.4 % +

## Pondération

Les données sont pondérées en hausse en fonction d'estimations démographiques indépendantes déterminées chaque mois par province, par âge et par sexe. Ces estimations sont présentées à la section 8 et font l'objet de révisions après chaque recensement. Le processus de pondération tient compte de la non-réponse, de l'expansion de l'échantillon et des variations dans la répartition des logements dans les diverses provinces. Pour de plus amples renseignements au sujet du processus de pondération, consulter Méthodologie de l'enquête sur la population active du Canada, n° 71-526 au catalogue.

## Indicateurs de l'écart-type

L'erreur d'échantillonnage, telle qu'elle est décrite plus haut, n'est pas connue. Cependant, il est possible d'estimer une mesure appelée l'écart-type à partir des données de l'échantillon. L'écart-type d'une estimation est une mesure statistique de la variabilité propre à l'estimation d'une caractéristique à laquelle on pourrait s'attendre si des échantillons répétés du même type étaient utilisés pour calculer ces estimations. De ce fait, il constitue une mesure de l'erreur d'échantillonnage. L'écart-type mesure aussi, en partie, l'effet de l'erreur non due à l'échantillonnage, mais ne saisit pas les biais systématiques contenus dans les données. Il y a environ 68 chances sur 100 pour que la différence entre une estimation d'échantillon et le chiffre de recensement correspondant soit inférieur à une fois l'écart-type. Il y a 95 chances sur 100 pour que la différence soit inférieure à deux fois l'écart-type, et environ 99 chances sur 100 qu'elle soit inférieure à deux fois et demie l'écart-type.

Des symboles littéraux de l'écart-type sont utilisés dans ce bulletin comme indicateurs de la fiabilité des estimations et sont fondés sur une moyenne de douze mois des écarts-types exprimés en pourcentage pour l'année civile précédente.

La lettre "A" indique qu'il s'agit d'une estimation très fiable; la lettre "B", que l'estimation est fiable mais à un degré moindre qu'une estimation de la catégorie "A", et ainsi de suite. De façon générale, les estimations publiées entrent dans les catégories "A" à "F" et sont suffisamment fiables pour la plupart des utilisations que l'on en fait. Certaines données dont la variabilité est plus élevée (dans les catégories "G" et "H") sont suffisamment fiables pour des utilisations particulières, mais il faut les utiliser avec beaucoup de circonspection. Par conséquent, chaque fois qu'on s'en servira par la suite, il faudra préciser que leur variabilité d'échantillonnage est plus élevée.

La lettre "J" indique l'estimation a une variabilité de plus de 33.3 % et (ou) qu'elle est plus petite que 4,000. Les estimations entachées d'une erreur d'échantillonnage de cet ordre ne sont pas publiées et sont remplacées par (...) dans les tableaux.

Le tableau présenté ci-dessous indique les désignations littérales des différentes catégories d'écart-type en pourcentage. Par exemple, la lettre "B" accolée à une estimation indique que l'écart-type se situe entre 0.6 % et 1.0 % de l'estimation. Par exemple, une estimation de 3,000,000 d'actifs de 15 à 24 ans serait suivie du symbole littéral "B". Par conséquent, l'écart-type de cette estimation se situe entre 18,000 et 30,000. Il y a 68 chances sur 100 pour que la valeur vraie de l'estimation s'établisse entre 2,970,000 et 3,030,000 actifs, et 95 chances sur 100 pour qu'elle se situe entre 2,940,000 et 3,060,000 actifs.

## Footnotes:

1. Work includes any work for pay or profit. That is, paid work in the context of an employer-employee relationship, or self-employment. It also includes unpaid family work where unpaid family work is defined as unpaid work which contributed directly to the operation of a farm, business or professional practice owned or operated by a related member of the household.
2. Persons in this group meeting the following criteria are regarded as available:
  - (i) were full-time students seeking part-time work who also met condition (ii) below. (Full-time students looking for full-time work are classified as not available for work in the reference week.)
  - (ii) reported that there was no reason why they could not take a job in reference week, or if they could not take a job it was because of "own illness or disability", "personal or family responsibilities", or already had a job.
3. Persons are classified as being on layoff only when they expect to return to the job from which they were laid off.
4. The MCD, or months for cyclical dominance, is a measure of the degree of smoothness in a seasonally adjusted series. It indicates the smallest span of months for which the average percent change in the trend cycle component is greater than in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 12. Applying a moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend.
5. Due to structural changes which have occurred in this series, data from 1985 onward have been adjusted using the multiplicative option as opposed to the additive option.
6. Due to structural changes which have occurred in this series, data from 1985 onward have been adjusted using the additive option as opposed to the multiplicative option.

## Notes:

1. On entend par "travail" tout travail fait contre rémunération ou en vue d'un bénéfice, c'est-à-dire le travail fait contre rémunération pour un employeur ou à son propre compte. Il peut également s'agir d'un travail familial non rémunéré, c'est-à-dire d'un travail non rémunéré qui contribue directement à l'exploitation d'une ferme, d'une entreprise ou d'un bureau professionnel, qui est possédé ou exploité par un membre apparenté du ménage.
2. On considère comme prêtes à travailler les personnes de ce groupe qui:
  - (i) étaient étudiants à plein temps cherchant du travail à temps partiel et qui répondaient également au critère (ii) ci-dessous. (Les étudiants à plein temps qui cherchaient du travail à plein temps ne sont pas considérés comme ayant été prêts à travailler pendant la semaine de référence.)
  - (ii) ont déclaré qu'il n'y avait aucune raison pour laquelle elles ne pouvaient prendre un emploi pendant la semaine de référence; ou ne pouvaient en prendre un en raison "d'une maladie ou d'une invalidité", "d'obligations personnelles ou familiales", ou "parce qu'elles avaient déjà un emploi".
3. On considère comme mises à pied seules les personnes qui s'attendent à réintégrer l'emploi qu'elles occupaient avant d'être mises à pied.
4. Le MDC (mois à dominance cyclique) est une mesure du degré de lissage d'une série désaisonnalisée. Il donne le plus petit nombre de mois pour lesquels le taux de variation moyen, compte non tenu du signe de la tendance générale, est supérieur à celui du facteur irrégulier. Dans le cas de la série la plus lissée possible, le MDC est égal à 1, dans celui de la série la plus irrégulière, il est égal à 12. L'application d'une moyenne mobile dont la période est égale au MDC tend à lisser les mouvements irréguliers pouvant dissimuler la tendance fondamentale.
5. Par suite des changements structurels survenus dans ces séries, les données pour 1985 ont été révisées selon la version multiplicative au lieu d'additive et le seront toujours ainsi pour les années à suivre.
6. Par suite des changements structurels survenus dans ces séries, les données pour 1985 ont été révisées selon la version additive au lieu de multiplicative et le seront toujours ainsi pour les années à suivre.
